CCR Due to MSDH & Customers by July 1, 2016!

MISSISSIPPI STATE DEPART BUREAU OF PUBLIC WA CCR CERTIFICA	MENT OF HEALTHSO PM 2: 40 ATER SUPPLY TION
Public Water Supply	etention Center
Public Water Supply  O250097  List PWS ID #s for all Community Water S	Systems included in this CCR
The Federal Safe Drinking Water Act (SDWA) requires each Common Consumer Confidence Report (CCR) to its customers each year. Do system, this CCR must be mailed or delivered to the customers, publish customers upon request. Make sure you follow the proper procedure email a copy of the CCR and Certification to MSDH. Please check	munity public water system to develop and distribute a epending on the population served by the public water hed in a newspaper of local circulation, or provided to the es when distributing the CCR. You must mail, fax or all boxes that apply.
Customers were informed of availability of CCR by: (Attac

## Hinds County Detention Center 2015 CCR 0250097 6/7/2016

Is my water safe?

Hinds County Detention Center is pleased to present this year's Annual Water Quality Report (Consumer Confidence Report) as required by the Safe Drinking Water Act (SDWA). This report is designed to provide details about where your water comes from, what it contains, and how it compares to standards set by regulatory agencies. This report is a snapshot of last year's water quality. We are committed to providing you with information because informed customers are our best allies. Last year, we conducted tests for over 80 contaminants. We only detected 7 of those contaminants, and found only 1 at a level higher than the EPA allows. As we informed you at the time, our water temporarily exceeded drinking water standards. (For more information see the section labeled Violations at the end of the report.)

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/Centers for Disease Control (CDC) guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available from the Safe Water Drinking (800-426-4791).

Where does my water come from?

Our well draws from the Cockfeild aquifer.

Source water assessment and its availability

Our rating is moderate.

Why are there contaminants in my drinking water?

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency's (EPA) Safe Drinking Water Hotline (800-426-4791).

The sources of drinking water (both lap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity:

microbial contaminants, such as viruses and bacteria, that may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife; inorganic contaminants, such as salts and metals, which can be naturally occurring or result from urban stormwater runoff, industrial, or domestic wastewater discharges, oil and gas production, mining, or farming, posticides and herbicides, which may come from a variety of sources such as agriculture, urban stormwater runoff, and residential uses; organic Chemical Contaminants, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations, urban stormwater runoff, and septic systems; and radioactive contaminants, which can be naturally occurring or be the result of oil and gas production and mining activities. In order to ensure that tap water is safe to drink, EPA prescribes regulations that limit the amount of certain contaminants in water provided by public water systems. Food and Drug Administration (FDA) regulations establish limits for contaminants in bottled water which must provide the same protection for public health.

How can I get involved?

Please contact our office with any questions or comments you may have.

Additional Information for Lead

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. North Hinds Water Association is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotling or at http://www.epa.gov/safewater/lead.

Water Quality Data Table

In order to ensure that tap water is safe to drink, EPA prescribes regulations which limit the amount of contaminants in water provided by public water systems. The table below lists all of the drinking water contaminants that we detected during the calendar year of this report. Although many more contaminants were tested, only those substances listed below were found in your water. All sources of drinking water contain some naturally occurring contaminants. At low levels, these substances are generally not harmful in our drinking water. Removing all contaminants would be extremely expensive, and in most cases, would not provide increased protection of public health. A few naturally occurring minerals may actually improve the taste of drinking water and have nutritional value at low levels. Unless otherwise noted, the data presented in this table is from testing done in the calendar year of the report. The EPA or the State requires us to monitor for certain contaminants less than once per year because the concentrations of these contaminants do not vary significantly from year to year, or the system is not considered vulnerable to this type of contamination. As such, some of our data, though representative, may be more than one year old. In this table you will find terms and abbreviations that might not be familiar to you. To help you better understand these terms, we have provided the definitions below the table.

MONITORING AND REPORTING OF COMPLIANCE DATA: During a sanitary survey conducted on 10/26/2011 the Mississippi Department of Health cited the following deficiency: well near source of feeal contamination; inadequate internal cleaning / maintenance of storage. Hinds County Detention center is working with Mississippi Department of Health is to correct these compliance issues by 6/30/2016.

During a sanitary survey conducted on 10/23/2014 the Mississippi Department of Health cited the following deficiency: unprotected cross connections; no approved emergency response plan or vulnerability analysis; inadequate security measures. Hinds County Detention Center is currently in cooperation with Mississippi Department of Health to correct these issues and be in compliance by 6/30/2016.

	MCLG or	MCL, TT, or	Your	R	ange	Sample		
<u>Contaminants</u>	MRDLG	MRDL	Water	Low	Hieh	<u>Date</u>	<u>Violation</u>	Typical Source
Disinfectants & Disinfectant	By-Products						,	
(There is convincing evidence	that addition of	a disinfectant	is necessary	for cont	rol of micr	obial contami	nants)	,
Chlorine (as CI2) (ppm)	4	4	0.6	ð.\$	0.7	2015	No	Water additive used to control microbes
TTHMs (Total Trihalomethanes) (ppb)	NA	80	80	ΝA		2014	Yes	By-product of drinking water disinfection
Haloacetic Acids (HAA5) (ppb)	NA	60	70	NA		2014	No	By-product of drinking water chlorination
Nitrate [measured as nitrogen](PPM)	10	10	.DB	na		2014	No	Runoff from fertilizer use; Leaching from septic tanks, sewage, erosion of natural denosits
Inorganic Contaminants	٠.		ı		:			

## Violations and Exceedances

## TTHAIs (Total Tribalomethanes)

Some people who drink water containing minatomethanes in excess of the MCL over many years may experience problems with their liver, kidneys, or central nervous system, and may have an increased risk of getting cancer. Some people who drink water containing trihalomethanes in excess of the MCL over many years may experience problems with their Liver, or central nervous system, and may have increased risk of cancer. A new well has been drilled and new lines installed, the system is now running in compliance within the maximum contaminant level.

Unit Descriptions						
Term	Definition					
ppm	ppm; parts per million, or milligrams per liter (mg/L)					
dad	ppb: parts per billion, or micrograms per liter (µg/L)					
NA	NA: not applicable					
ND	NO: Not detected					
NR	NR: Monitoring not required, but recommended					

Important Drinking Water Definitions	
Тегш	Definition
MCLG	MCLG: Maximum Contaminant Level Goal: The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.
MCL	MCL: Maximum Contaminant Level: The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.
TT	TT: Treatment Technique: A required process intended to reduce the level of a contaminant in drinking water.
ΑĽ	AL: Action Level: The concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow.
Variances and Exemptions	Variances and Exemptions: State or EPA permission not to meet an MCL or a treatment technique under certain conditions.
MRDLG	MRDLG: Maximum residual disinfection level goal. The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.
MRDL	MRDL: Maximum residual disinfectant level. The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.
MNR	MNR: Monitored Not Regulated
MPL	MPL: State Assigned Maximum Permissible Level
